Minimum Sum of Radii (MSR) and Diameters (MSD) Problem

Input: a metric (V, d): can be seen as an edge-weighted complete graph, an integer k.

Introduction	Related Works and new results	Our Results	Conclusion
●00		000000000	00

Problem Statement

Minimum Sum of Radii (MSR) and Diameters (MSD) Problem

- Input: a metric (V, d): can be seen as an edge-weighted complete graph, an integer k.
- **Goal:** partition the points of V into at most k clusters V_1, V_2, \ldots, V_k .

Problem Statement

Minimum Sum of Radii (MSR) and Diameters (MSD) Problem

- Input: a metric (V, d): can be seen as an edge-weighted complete graph, an integer k.
- **Goal:** partition the points of V into at most k clusters V_1, V_2, \ldots, V_k .
- **Objective:** minimize $\sum_{i=1}^{k} \operatorname{rad}(V_i)$ in MSR, minimize $\sum_{i=1}^{k} \operatorname{diam}(V_i)$ in MSD.
- **Radius and Diameter:** $rad(V_i) = \min_{u \in V_i} \max_{v \in V_i} d(u, v)$, $diam(V_i) = \max_{u,v \in V_i} d(u, v)$

- New polygon is simpler: determined by $O(1/\epsilon)$ points $\rightarrow O(n^{1/\epsilon})$ new polygons.
- size *c* subsets of new polygons, enumerable in $O(n^{\frac{c}{\epsilon}})$.
- Intuitive Example: A regular polygon and the polygon constructed from extension of every *i*th edges of it
